Point72

RE: Web Scraping, Data Engineer

Hello,

I came across the open role at Point72 while browsing on LinkedIn, due to a mutual connection working at the organization. On going through the Job Description thoroughly, I found out that the requirements and responsibilities associated with the role are inline with my future aspirations. I'll be pleased to add value and solve complex problems.

In the past I have actively worked in data acquisition. Working at India's one of the leading data science company, I have performed large scale web scraping from a plethora of E-commerce websites. In my journey i have encountered and solved multiple crawling issues like Captchas, Language barriers, Lazy loading, and parsing complex DOM elements.

My technical skills include Python, Nodejs, Javascript, Java and Angular. I have worked extensively with web scraping libraries like selenium, chromedriver, scrapy and BeautifulSoup. I am also enthusiastic about financial markets and actively follow it. I have developed crawling scripts for multiple financial data providers like Trading view, to help provide traders with a summarized data of all listed companies in a single document.

For a greater presentation of my background and qualifications, please review my attached resume. I am eager to speak with you and greatly appreciate your consideration.

Sincerely,

Bhargav Sarvaria
